**Using WebSphere Message Broker V8 in Mid-Market Environments** - Carla Sadtler  
2012-08-31

IBM WebSphere® Message Broker is a lightweight, advanced enterprise service bus (ESB) that provides a broad range of integration capabilities that enable companies to rapidly integrate internal applications and connect to partner applications. Messages from business applications can be transformed, augmented and routed to other business applications. The types and complexity of the integration required will vary by company, application types, and a number of other factors.

Message Broker is implemented using message flows. Through message flows, messages from business applications can be transformed, augmented, and routed to other business applications. Message flows are created by connecting nodes together. A wide selection of built-in nodes are provided with WebSphere Message Broker. These nodes perform tasks that are associated with message routing, transformation, and enrichment. Message flows are created and tested using the Message Broker Toolkit, a sophisticated, easy-to-use programming tool that provides a full range of programming aids. This IBM® Redbooks® publication focuses on two specific integration requirements that apply to many midmarket companies. The first is the ability to use WebSphere Message Broker to integrate Microsoft.NET applications into a broader connectivity solution. WebSphere Message Broker V8 introduces the ability to

integrate with existing Microsoft .NET Framework applications. A .NET assembly can be called from within a message flow and the WebSphere Message Broker runtime can host and run .NET code. Solutions explored in this book cover connectivity to applications using Windows Communications Framework (WCF), Microsoft Message Queuing, Microsoft Dynamics CRM, and other Microsoft applications. The second is the ability to integrate WebSphere Message Broker with file transfer networks, specifically with WebSphere MQ File Transfer Edition and IBM Sterling Connect Direct. *Central Finance and SAP S/4HANA* - Carsten Hilker 2020 "Start your CFin project! Critical Success Factors in Enterprise Resource Planning Implementation in U. S. Manufacturing - Justin

Goldston 2019-01-21

Enterprise Resource Planning (ERP) implementations can be costly for any company. While there are advantages to size and funding in larger businesses (500+ employees), there are critical success factors of the ERP process that small- to mid-size manufacturing (or other types of business organizations) can use to increase their rate of success for ERP. This must-buy book outlines research that targeted specific factors that increase any ERP implementation's success. Critical success factors were identified, and ranked, by 50+ subject matter expert consultants in the ERP field in this study. These SMEs, all with more than five years of experience in implementing ERPs for manufacturers, provided a consensus for best-practices factors vital for consideration for the ERP implementation, before, during, and after the exercise. Critical factors (failure and success) are highlighted for the planning, process, and follow-

up, with positive internal and external results from the executive (top-down) buy-in to the communications and transparency of the process to middle management and line employee stakeholders. The vital points in the conclusion offer guidance to organizations, as well as ERP consultants, that are considering ERP implementation, even if the entity is not in the manufacturing industry. If you or your company is seriously considering an ERP project, this book is a required reading for industry intelligence and analytic insight. **Information Lifecycle Management (ILM)** provides solutions. ILM is the process of managing information-from creation, through its useful life, to its eventual destruction-in a manner that aligns storage costs with the changing business value of information. We can think of ILM as an integrated solution of five IT management and infrastructure components working together: Service management (service levels), content management, workflow management (or process management), storage management, and storage infrastructure. This IBM Redbooks publication will help you understand what ILM is and why it is of value to you in your organization, and provide you with suggested ways to implement it using IBM products.

IBM DB2 Web Query for i: The Nuts and Bolts - Hernando Bedoya 2017-05-11

Business Intelligence (BI) is a broad term that relates to applications that analyze data

*Downloaded from

to understand and act on the key metrics that drive profitability in an enterprise. Key to analyzing that data is providing fast, easy access to it while delivering it in formats or tools that best fit the needs of the user. At the core of any BI solution are user query and reporting tools that provide intuitive access to data supporting a spectrum of users from executives to "power users," from spreadsheet aficionados to the external Internet consumer. IBM® DB2® Web Query for i offers a set of modernized tools for a more robust, extensible, and productive reporting solution than the popular IBM Query for System i® tool (also known as IBM Query/400). IBM DB2 Web Query for i preserves investments in the reports that are developed with Query/400 by offering a choice of importing definitions into the new technology or continuing to run existing Query/400 reports as is. But, it also offers significant productivity and performance enhancements by leveraging the latest in DB2 for

i query optimization technology. The DB2 Web Query for i product is a web-based query and report writing product that offers enhanced capabilities over the IBM Query for iSeries product (also commonly known as Query/400). IBM DB2 Web Query for i includes Query for iSeries technology to assist customers in their transition to DB2 Web Query. It offers a more modernized, Java based solution for a more robust, extensible, and productive reporting solution. DB2 Web Query provides the ability to query or build reports against data that is stored in DB2 for i (or Microsoft SQL Server) databases through browser-based user interface technologies: Build reports with ease through the web-based, ribbon-like InfoAssist tool that leverages a common look and feel that can extend the number of personnel that can generate their own reports. Simplify the management of reports by significantly reducing the number of report definitions that are required

through the use of parameter driven reports. Deliver data to users in many different formats, including directly into spreadsheets, or in boardroom-quality PDF format, or viewed from the browser in HTML. Leverage advanced reporting functions, such as matrix reporting, ranking, color coding, drill-down, and font customization to enhance the visualization of DB2 data. DB2 Web Query offers features to import Query/400 definitions and enhance their look and functions. By using it, you can add OLAP-like slicing and dicing to the reports or view reports in disconnected mode for users on the go. This IBM Redbooks® publication provides a broad understanding of what can be done with the DB2 Web Query product. This publication is a companion of DB2 Web Query Tutorials, SG24-8378, which has a group of self-explanatory tutorials to help you get up to speed quickly.

*Surgical Principles of Minimally Invasive Procedures*

- H. Jaap Bonjer 2017-05-29

The EAES Manual of Endoscopic Surgery provides

surgeons and surgical residents with the best practical knowledge currently available on commonly performed minimally invasive abdominal and thoracic procedures. Expert European surgeons share their career-long experience by dissecting operative procedures step by step and highlighting potential technical and anatomical hazards. Authors instruct the reader in a fashion similar to the conversations that take place between master surgeons and their apprentices while scrubbing for surgery. Uniform full color illustrations complete the detailed descriptions of minimally invasive surgeries. In addition to the operative instructions, a key component of the manual is the provision of information on patient selection, choice of operative approach, special needs for minimally invasive procedures, and the early diagnosis and treatment of complications after surgery.
