Occupational Risk Control - Derek Viner 2016-03-03

In Occupational Risk Control, Derek Viner brings together the theoretical aspects of his subject into a coherent whole and then connects them with the needs both of practitioners and educators. The theory embraced by the author spans ideas formed between the industrial revolution and the present day, but he focuses on relatively more recent theoretical developments chiefly associated with people-orientated approaches in the discipline of psychology applied to management practice and in the application of analytical ideas to engineering design. The author looks specifically at developments in defence and petro-chemical systems and also considers the whole theory of risk that originated in the 1970s with the advent of nuclear power stations, but which he argues has advanced little since that time. He also introduces the geological and botanical sciences, on the grounds that they contribute much to our understanding of how to set about classifying phenomena. To this mix, is added the contribution of law to our understanding of moral obligations and that of statistics to our understanding of the management of uncertainty. Viner argues that amongst the observable consequences of the absence of a holistic approach, is the tendency for regulators to form (misinformed) theory on which to base legislation and the prevalence of commercial systems leading to disparate efforts by different industries. The net effect of all this, he suggests, is seen in the disasters of the magnitude of the Gulf of Mexico explosion and oil spill.

Principles of Fire Risk Assessment in Buildings - David Yung 2008-12-17

This book arrives at just the right time to facilitate understanding of performance-based fire risk assessment in buildings – an integral part of the global shift in policy away from traditional prescriptive codes. Yung, an internationally recognised expert on the subject of fire risk assessment, introduces the basic principles and techniques that help the reader to understand the various methodologies that are currently in place or being proposed by different organisations. Through his illustration of basic principles and techniques he enables the reader to conduct their own fire risk assessments. He demonstrates how the probabilities of fire scenarios are assessed based on the probabilities of success and failure of fire protection measures that are in place. He also shows how the consequences of fire scenarios are assessed based on the intensity and speed of fire and smoke spread, the probability and speed of occupant response and evacuation, and the effectiveness and speed of fire department response and rescue efforts. Yung's clear and practical approach to this highly topical subject enables the reader to integrate the various tools available into a quantitative framework that can be used for decision making. He brings an invaluable resource to all those involved in fire engineering and risk assessment, including students, academics, building designers, fire protection engineers, structural engineers, regulators and risk analysts.
