The Biopsychology of Mood and Arousal - Robert E.

Thayer 1990-09-27

What is the biological function of daily mood variations? What is the relationship between mood and such factors as exercise, time of day, nutrition, stress, and illness? Drawing on his own wide-ranging research concerning subjective assessments of mood and on extensive research by others, Dr. Thayer presents a

comprehensive theory of normal mood states, viewing them as subjective components of two biological arousal systems, one which people find energizing, and the other which people describe as producing tension. The author explains these two mood effects in relation to a complex relationship between energy and tension. Relevant research is systematically reviewed, and moods are analyzed in relation to circadian rhythms, exercise, nutrition, sleep, stress, and cognition. Perceptual and motivational effects of mood are also discussed, as are measurement and research design issues. Unique in its depth and comprehensiveness, this book will be of interest not only to researchers in psychology, biology, and medicine, but its clear style of presentation and the practical activities suggested for mood regulation will make it interesting to general readers as well.

Assessing Intelligence in Children and Adolescents -
John H. Kranzler 2020-08-27

This book is a practical guide to the intellectual assessment of children and adolescents in the schools. Although primarily intended for graduate students in school psychology training programs and practicing school psychologists, it should also be useful for those involved with making decisions in schools that are based, in part, on the results of intelligence tests, including counselors, teachers, administrators, and other school personnel. In writing it, we placed particular emphasis on evidence-based practices pertaining to the use and interpretation of intelligence tests. The assessment of intelligence has long been mandated by law for eligibility determination for special education and related services. At the current time, however,

Downloaded from

there is widespread disagreement about the use and interpretation of intelligence tests.

Nevertheless, none of the currently available books on intellectual assessment critically reviews the scientific evidence regarding the critical role played by intelligence tests in the schools for the determination of eligibility for special education and related services. One of the main intentions of this book was to fill that gap and to recommend best practices with scientific support.

No sweeping epics here, these collected poems are essentially lyrical vignettes, mood-evocations drawn from experience, imagination, and an introspective sifting through the human contentions and passions. Melancholic in tone (even the few comic pieces spring from irony) the book's motifs bypass the transient social and political issues, pursuing the ineffable, beauty's elusive order, the flickering lights in the darkness of life's angst. circumcision, his family agreed to a radical treatment that would alter his gender. The case would become one of the most famous in modern medicine—and a total failure. The boy's uninjured brother, raised as a boy, provided to the experiment the perfect matched control. As *Nature Made Him* tells the extraordinary story of David Reimer, who, when finally informed of his medical history, made the decision to live as a male. Writing with uncommon intelligence, insight, and compassion, John Colapinto sets the historical and medical context for the case, exposing the thirty-year-long scientific feud between Dr. John Money and his fellow sex researcher, Dr. Milton Diamond—a rivalry over the nature/nurture debate whose very bitterness finally brought the truth to light. A macabre tale of medical arrogance, it is first and foremost a human drama of one man's—and one family's—amazing survival in the face of terrible odds.

Other chapters summarize basic techniques for tissue preparation and sectioning; present guidelines for a number of standard, but essential, staining procedures; and present sophisticated and contemporary computer techniques that are proving to be invaluable as neuroanatomy evolves from a qualitative to a quantitative discipline. Part II deals with techniques often used for the study of normal tissue. These include the Golgi

method, fluorescence histochemistry, techniques for staining single neurons, and the use of the electron microscope. Part III presents techniques for studying intrinsic connections of the nervous system. These include techniques for silver impregnation of degenerating fibers; autoradiographic technique for studying axonal projections; and somatopetal movement of horseradish peroxidase as a tool for studying connections and neuron morphology. I Want That! - Thomas Hine
2003-10-14

Shopping has a lot in common with sex. Just about everybody does it. Some people brag about how well they do it. Some keep it a secret. And both provide ample opportunities to make foolish choices. Choosing and using objects is a primal human activity, and I Want That! is nothing less than a portrait of humanity as the species that shops. It explores the history of acquisition -- finding, choosing, spending -- from our amber-coveting Neolithic forebears to Renaissance nobles who outfitted themselves for power to twenty-first-century bargain hunters looking for a good buy on eBay. I Want That! explores the minds of shoppers in the quest to nourish and feed fantasies, to define individuality, to provide for family, and to satisfy the needs for celebration, power, and choice -- all of which lead us to malls, boutiques, websites, and superstores.
