Drug Evaluation in Angina Pectoris - Gianluigi Ardissino
2012-12-06

Although there are many books on angina, few are devoted to the important problem of how to evaluate drug efficacy in angina pectoris. Drug Evaluation in Angina Pectoris has two fundamental aims: the first is to review the methodological aspects of drug evaluation in stable and unstable angina pectoris; the second is to provide a logical and methodological background for future studies aimed at assessing the ability of medical treatment to improve prognosis. Part I updates the pathophysiology, clinical presentation and prognosis of angina pectoris. Part II aims to 'put in numbers' the symptoms and signs of myocardial ischemia, starting from a revision of the currently used parameters. It is extremely important to quantify the variability of the disease for the correct design

of clinical trial, a subject dealt with in Part III, which also discusses some clinico-pharmacological aspects of therapy. Part IV is a critical review of the drugs currently used for the treatment of stable and unstable angina, and particularly considers some important unresolved issues concerning their use. The current FDA and EC guidelines for the evaluation of antianginal drugs are briefly discussed in Part V, giving clinical investigators insight into how antianginal drugs are evaluated by regulatory agencies and what is considered as proof of a valid efficacy/tolerability ratio. Drug Evaluation in Angina Pectoris will assist discerning cardiologists, pharmacologists, and advanced students of cardiology as well as innovative pharmaceutical companies, all of whom need to understand what angina is, how to evaluate treatment, and how to judge the agents used in its treatment.

Drug Discovery - Robert A. Maxwell 2012-12-06

This treatise had its origins in the authors' strong opinion that the discovery of new drugs, especially of innovative therapeutic agents, really does not happen as a spontaneous sequel to investigative research, no matter how penetrating such research may be. Rather, it seemed to us that the discovery of innovative therapeutic agents was a very active process, existing in and of itself, and demanding full attention-it was not simply a

passive, dependent by-process of investigative research. And yet, many researchers some close confreres of the authors, others more distant-believed otherwise. We felt that their view reflected unrealistic thinking and that reality probably lay closer to what Beyer" maintained: We are taught to believe that if we can understand a disease it should be easy enough to figure out, say, the molecular configuration of a definitive receptor mechanism somewhere along the line and to design a specific drug And so we start out to understand the disease but never get around to doing much about therapy. The authors very soon realized that there was essentially no quantitative information available on just where and how innovative therapeutic agents were discovered. There were only anecdotal accounts, and these were able to be selected and presented in ways that could be used to defend any point of view.
